

IS-NITRO-CAPTURE Video Adjustment Utility

[@famiac](#) and I wanted to remove the aspect ratio "fix". The "fix" would apply uneven scaling which isn't pixel perfect...

Thus we created this utility to remove that "feature". This utility will patch the firmware, enabling the patch to persist and work without having a PC connected.

As always, lots of thanks to [@Gericom](#) for documenting the IS-NITRO-EMULATOR and the IS-NITRO-CAPTURE hardware registers.

Note this utility is only for the CAPTURE. We have made patches for the EMULATOR in another post.

Introduction

This utility features removing the aspect ratio fix and adjusting the video offsets.

(Removing the aspect ratio fix will cause the image to be uncentered. Plus, we want fine adjustments for a CRT setup.)

For convenience, the utility auto-increments the firmware version so we don't have to reset the firmware everytime we wanted to adjust the video offsets. (ISNP.exe checks if the firmware version is higher than the version installed onto the machine.)

This utility relies on Cheat Engine. Our process patches the firmware stored inside RAM when ISNP.exe runs.

Prerequisites

- Use Windows 7 or earlier
- Install Cheat Engine 7.1 or greater
- Install IS-NITRO-CAPTURE_v2_15_07102300.exe
 - Under Win7, use XP SP3 compatibility mode to install

Usage

1. Open ISNP.exe
2. Open ISNP-Patcher.CT
3. Press **[Scan Firmware!]** The signature, type, and version should be updated.
4. Select any of the options you want to patch.
 - **Patch Version**
 - The firmware version should be 0x1DE.
 - Please enable it; The version number must be higher than the current version.
 - **Remove Aspect Ratio Fix**
 - There are 3 options for DIP2 configuration. When DIP2 is OFF, ON, or Always (Ignore DIP2).
 - (DIP2 allows user settings separate from the default.)
 - **Adjust Video Offsets**
 - You can adjust the settings for each AV out.
 - X and Y offsets for single screen mode.
 - X and Y offsets for dual screen mode.
5. Finally, press **[Apply Patch!]**
6. In ISNP.exe, proceed with a firmware update as usual.

Method for Centering the Image

When the aspect ratio fix is removed, the bottom left corner of the image stays the same using the same offset values.

The image horizontally shrinks by 64 pixels (on a 640*480px grid).

To center the image, Famiac added 32 to the X offset. The Y offset is centered by eye according to the specific monitor.

Famiac's Values:

- Single Screen X & Y: 0xE4, 0x2A
- Dual Screen X & Y: 0x60, 0x26
- Default Single: 0xC4, 0x2E (for reference)

Single Screen Ranges:

- X: 0x87 (left), 0xF6 (right)
- Y: 0x1C (top), 0x3E (bottom)

The ranges represent when the image touches the left, right, top, or bottom edges.

Comments:

Based on the ranges, these units roughly correspond to a 640*480 resolution.

X: $0xF6 - 0x87 = 0x6F = 111px$; $256 * 2 = 512px$ (NDS X Res * 2); $512 + 111 = 623px$

Y: $0x3E - 0x1C = 0x22 = 34px$; $192 * 2 = 384px$ (NDS Y Res * 2); $384 + 34 = 418px$

Technical Details

The firmware is stored inside ISNP.exe and not in some DLL file.

We believe ISNP.exe is packed by ASProtect (ASProtect 2.0x as reported by PEiD). We did manage to unpack the program but we couldn't figure out a way to make it run after patching it... Thus, we gave up on that route... (If you want to give it a shot, I have tried using ImpREC 1.7e and Skylla to try "repacking" the program...)

Regardless, we figure using Cheat Engine might work... and indeed it does! We searched for the firmware header in memory and was able to patch it using Cheat Engine. Thus after a few lines of Lua and making a GUI inside the GUI editor for Cheat Engine, we had a working patcher.

The firmware is "encrypted" simply by decrementing/incrementing each byte... (Just like the firmware for EMULATOR.) Try searching for "HMSDKKHFDMs". (This is what our LUA script searches for to get the reference point for the firmware.)

Look at "script.lua" and "ISNP.CT" if you want to take a look at the code or adjust it. A majority of the code is GUI related while the rest references locations inside the firmware. (Various byte changes here and there...) GUI "code" is done via Cheat Engine's form design tool. Since Cheat Engine can edit memory, executables produced by Cheat Engine can be flagged as viruses... Which is why we opted to use the *.CT format. (Since it's just text afterall.)
